

LEARN TO CODE FROM SCRATCH WITH PYTHON 3

LEARN TO CODE FROM SCRATCH WITH PYTHON 3.....	1
1. PART I : LEARN TO CODE	2
2. PART II : STEP BY STEP LEARN BASIC PYTHON PROGRAMMING	11
3. PART III : STEP BY STEP LEARN ADVANCE PYTHON PROGRAMMING	11
4. PART IV : PROJECTS	11

1. PART I : LEARN TO CODE

1.1. STEP 1: How to start coding/programming in any language

1.1.1. How do you calculate

1.1.2. Some best practices

- **Start writing pseudo code**
- **Convert pseudo code into a diagram**
- **Brush up some basic maths**
- **Analytical Reasoning**

1.2. STEP 2 : Basic Building Block Of Any Programming Language

1.2.1. Variables

1.2.2. Keywords

1.2.3. Operators

1.2.4. Decisions

1.2.5. Loops

1.2.6. Numbers

1.2.7. Characters

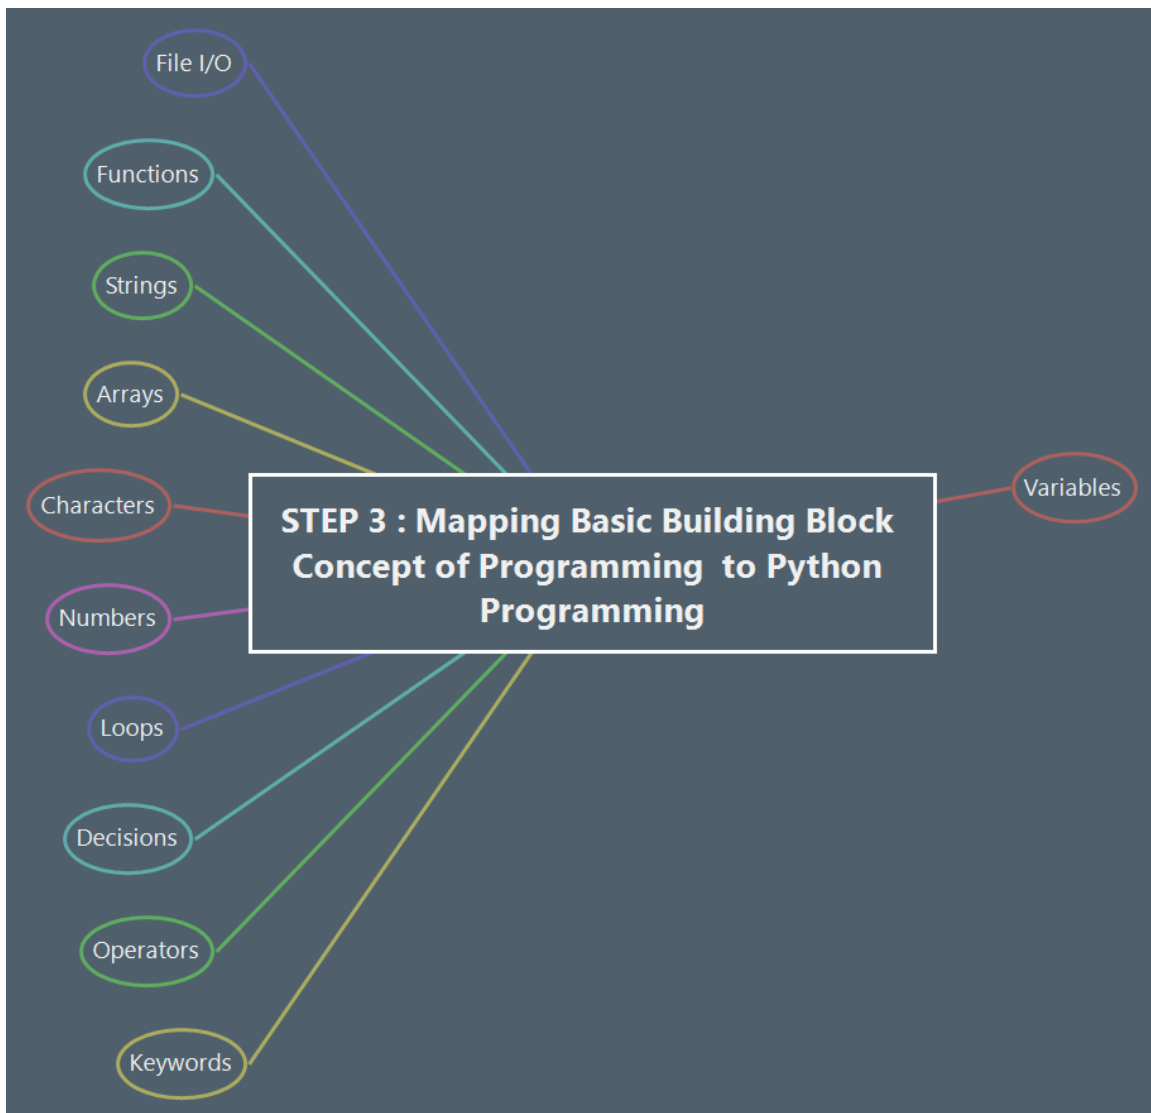

1.2.8. Arrays

1.2.9. Strings

1.2.10. Functions

1.2.11. File I/O

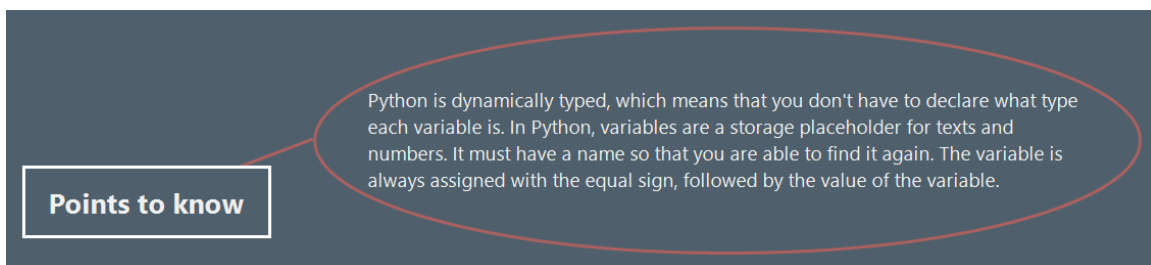

1.3. STEP 3 : Mapping Basic Building Block Concept of Programming to Python Programming

1.3.1. Variables

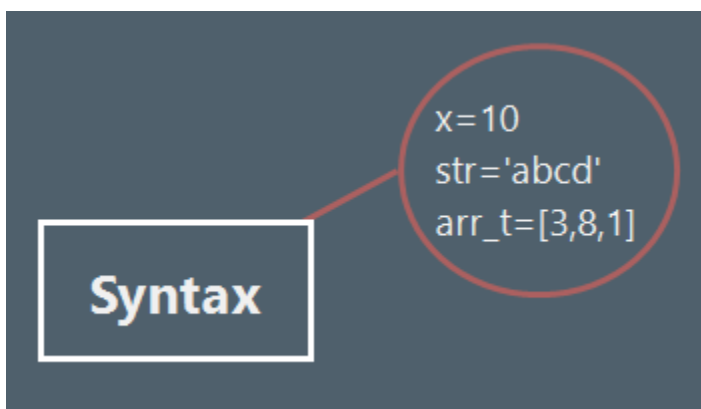

Points to know

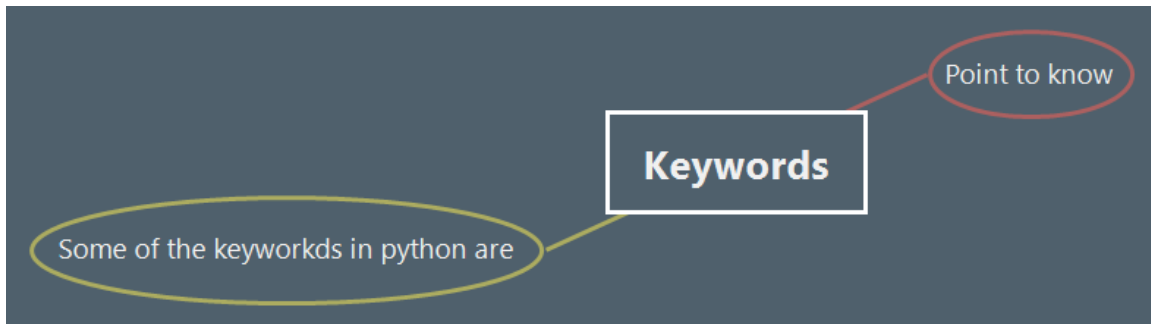

Python is dynamically typed, which means that you don't have to declare what type each variable is. In Python, variables are a storage placeholder for texts and numbers. It must have a name so that you are able to find it again. The variable is always assigned with the equal sign, followed by the value of the variable.

Syntax

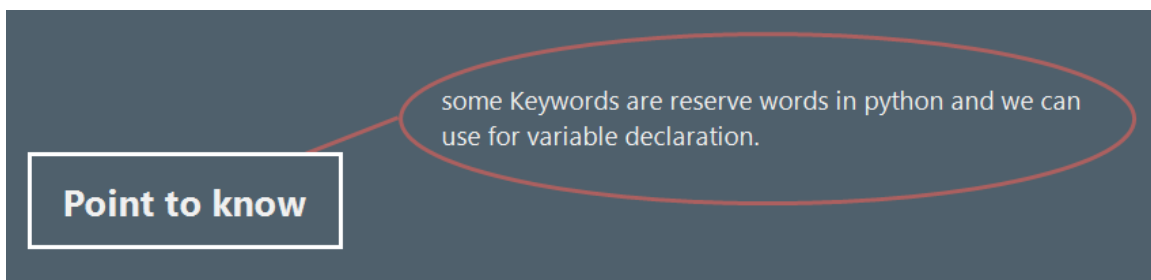

```
x=10  
str='abcd'  
arr_t=[3,8,1]
```

1.3.2. Keywords

Point to know

some Keywords are reserve words in python and we can use for variable declaration.

Some of the keywords in python are

1.3.3. Operators

1.3.4. Decisions

1.3.5. Loops

1.3.6. Numbers

1.3.7. Characters

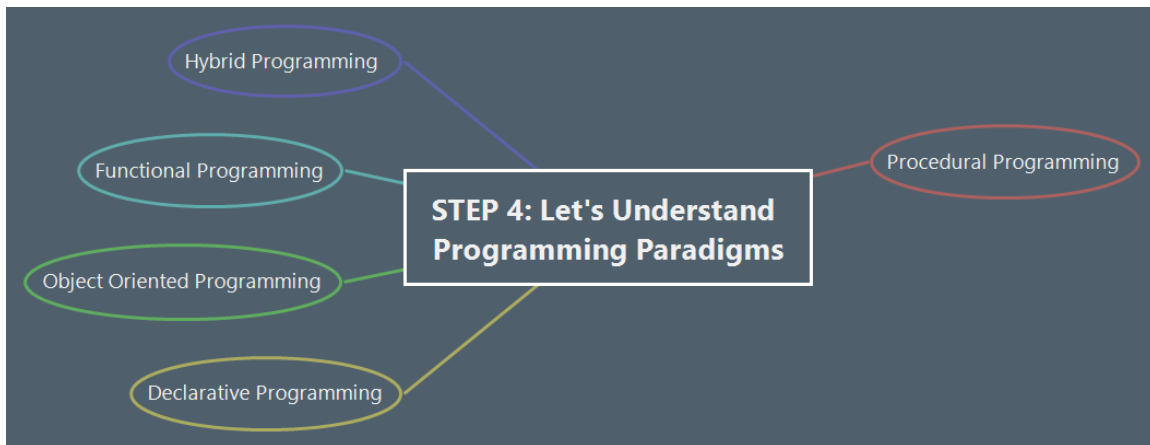

1.3.8. Arrays

1.3.9. Strings

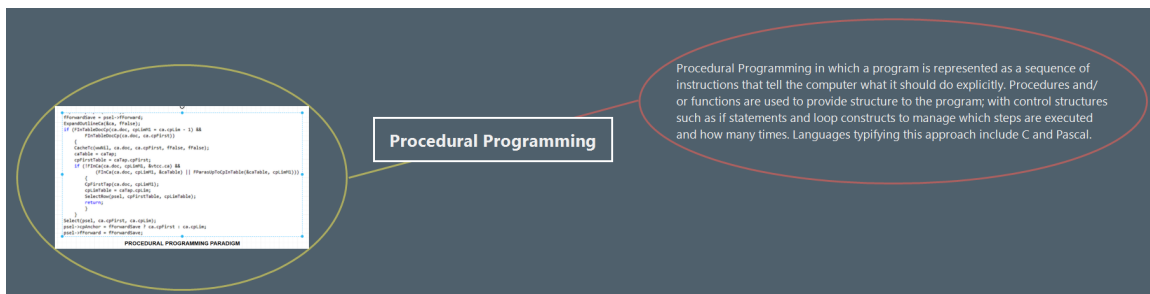

1.3.10. Functions

1.3.11. File I/O

1.4. STEP 4: Let's Understand Programming Paradigms

1.4.1. Procedural Programming

Procedural Programming in which a program is represented as a sequence of instructions that tell the computer what it should do explicitly. Procedures and/or functions are used to provide structure to the program; with control structures such as if statements and loop constructs to manage which steps are executed and how many times. Languages typifying this approach include C and Pascal.

1.4.2. Declarative Programming

Declarative Programming

```
SELECT SUBSTR(str, (der.statement_start_offset / 2) + 1,
              (CASE der.statement_end_offset
                WHEN -1 THEN DATALENGTH(str)
                ELSE der.statement_end_offset
                - der.statement_start_offset
                + 1) / 2 + 1) AS querystatement,
       der.query_plan,
       der.session_id,
       der.start_time,
       der.status,
       DB_NAME(der.database_id) AS DBName,
       USER_NAME(der.user_id) AS UserName,
       der.blocking_session_id,
       der.locking_session_id,
       der.request_time
FROM sys.dm_exec_requests AS der
WHERE der.status = 'running'
ORDER BY der.start_time
```

Declarative Programming languages, such as Prolog, that allow developers to describe how a problem should be solved, with the language/environment determining how the solution should be implemented. SQL (a database query language) is one of the most common declarative languages that you are likely to encounter

Declarative Programming languages, such as Prolog, that allow developers to describe how a problem should be solved, with the language/environment determining how the solution should be implemented. SQL (a database query language) is one of the most common declarative languages that you are likely to encounter

1.4.3. Object Oriented Programming

Object Oriented Programming

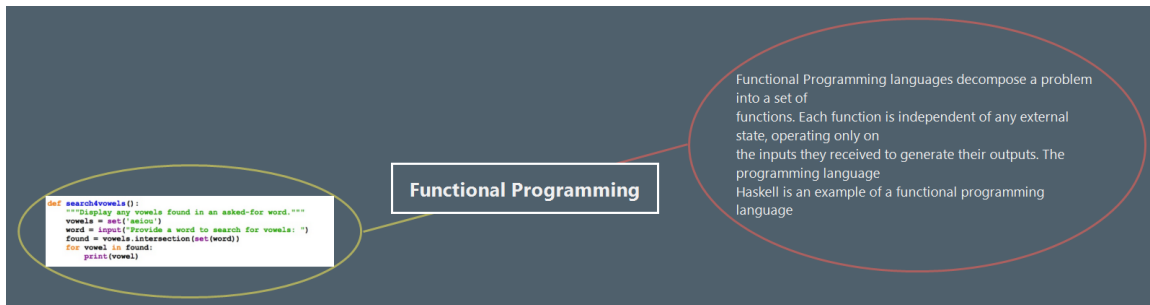

Object Oriented Programming approaches that represent a system in terms of the objects that form that system. Each object can hold its own data (also known as state) as well as define behaviour that defines what the object can do. A computer program is formed from a set of these objects co-operating together. Languages such as Java and C# typify the object oriented approach.

Object Oriented Programming approaches that represent a system in terms of the objects that form that system. Each object can hold its own data (also known as state) as well as define behaviour that defines what the object can do. A computer program is formed from a set of these objects co-operating

together.

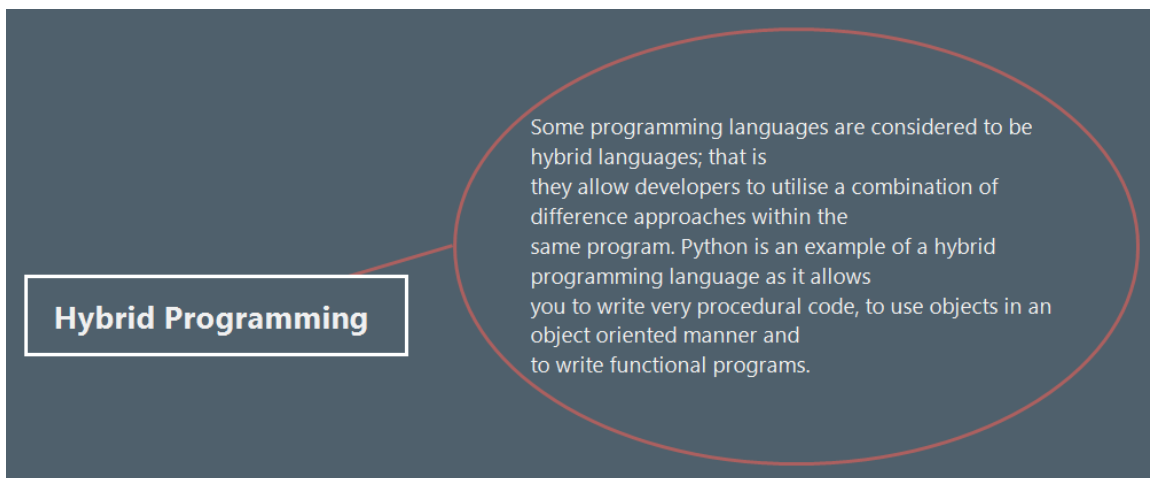

Languages such as Java and C# typify the object oriented approach.

1.4.4. Functional Programming

Functional Programming languages decompose a problem into a set of functions. Each function is independent of any external state, operating only on the inputs they received to generate their outputs. The programming language Haskell is an example of a functional programming language

1.4.5. Hybrid Programming

Some programming languages are considered to be hybrid languages; that is they allow developers to utilise a combination of difference approaches within the same program. Python is an example of a hybrid programming language as it

allows

you to write very procedural code, to use objects in an object oriented manner
and

to write functional programs.

2. PART II : STEP BY STEP LEARN BASIC PYTHON PROGRAMMING

3. PART III : STEP BY STEP LEARN ADVANCE PYTHON PROGRAMMING

4. PART IV : PROJECTS

4.1. Project I : IMDB Web Scraper

4.1.1. Create a Tool with all the knowledge we gained in this journey

4.2. Project II: Create a Game called Snake
